

Use-Case Flow Specification

Campus Placement & Internship Pipeline

Use Case: UC1 – Apply for Placement Drive

Primary Actor: Student Applicant

Secondary Actors: Placement Officer, Company Recruiter

Includes: UC2 – Verify Eligibility (always executed)

Preconditions

- The Student Applicant has a registered, verified account on the placement portal.
- The Company Recruiter has posted an active drive with defined eligibility criteria (CGPA cutoff, backlog limit, branch).
- The Placement Officer has configured the CGPA/backlog eligibility filters (FR-002).

Postconditions

- **Success:** The application is recorded with status '**Applied**' and the applicant is notified.
- **Failure:** No application record is created, and the applicant is shown the reason for failure.

Main Success Scenario

- 1 Student Applicant logs in and selects an active company drive from the placement portal.
- 2 System displays the drive details and eligibility criteria (CGPA cutoff, backlog limit, branch).
- 3 Student Applicant uploads a resume (PDF) and clicks 'Apply'.
- 4 System parses the resume, extracts skill tags, and pulls the applicant's academic record (CGPA, active backlogs).
- 5 System executes '**Verify Eligibility**' (UC2 – include): it checks the applicant's CGPA and backlog count against the eligibility filters configured for the drive.
- 6 Eligibility check passes: system marks the application as '**Applied**' and adds the applicant to the **applicant pool**.
- 7 System sends a confirmation notification to the Student Applicant and updates the Placement Officer's dashboard.
- 8 Use case ends successfully.

Alternate Flow

5a. Applicant Fails Eligibility Check

- 1 System detects the applicant's CGPA is below the configured cutoff, or the applicant has an active backlog above the allowed limit.
- 2 System rejects the application, sets status to '**Rejected – Ineligible**', and displays the specific discrepancy reason (e.g., '*CGPA 6.8 below required 7.5*').
- 3 Student Applicant is notified of the rejection reason and the use case ends without adding the applicant to the applicant pool.
